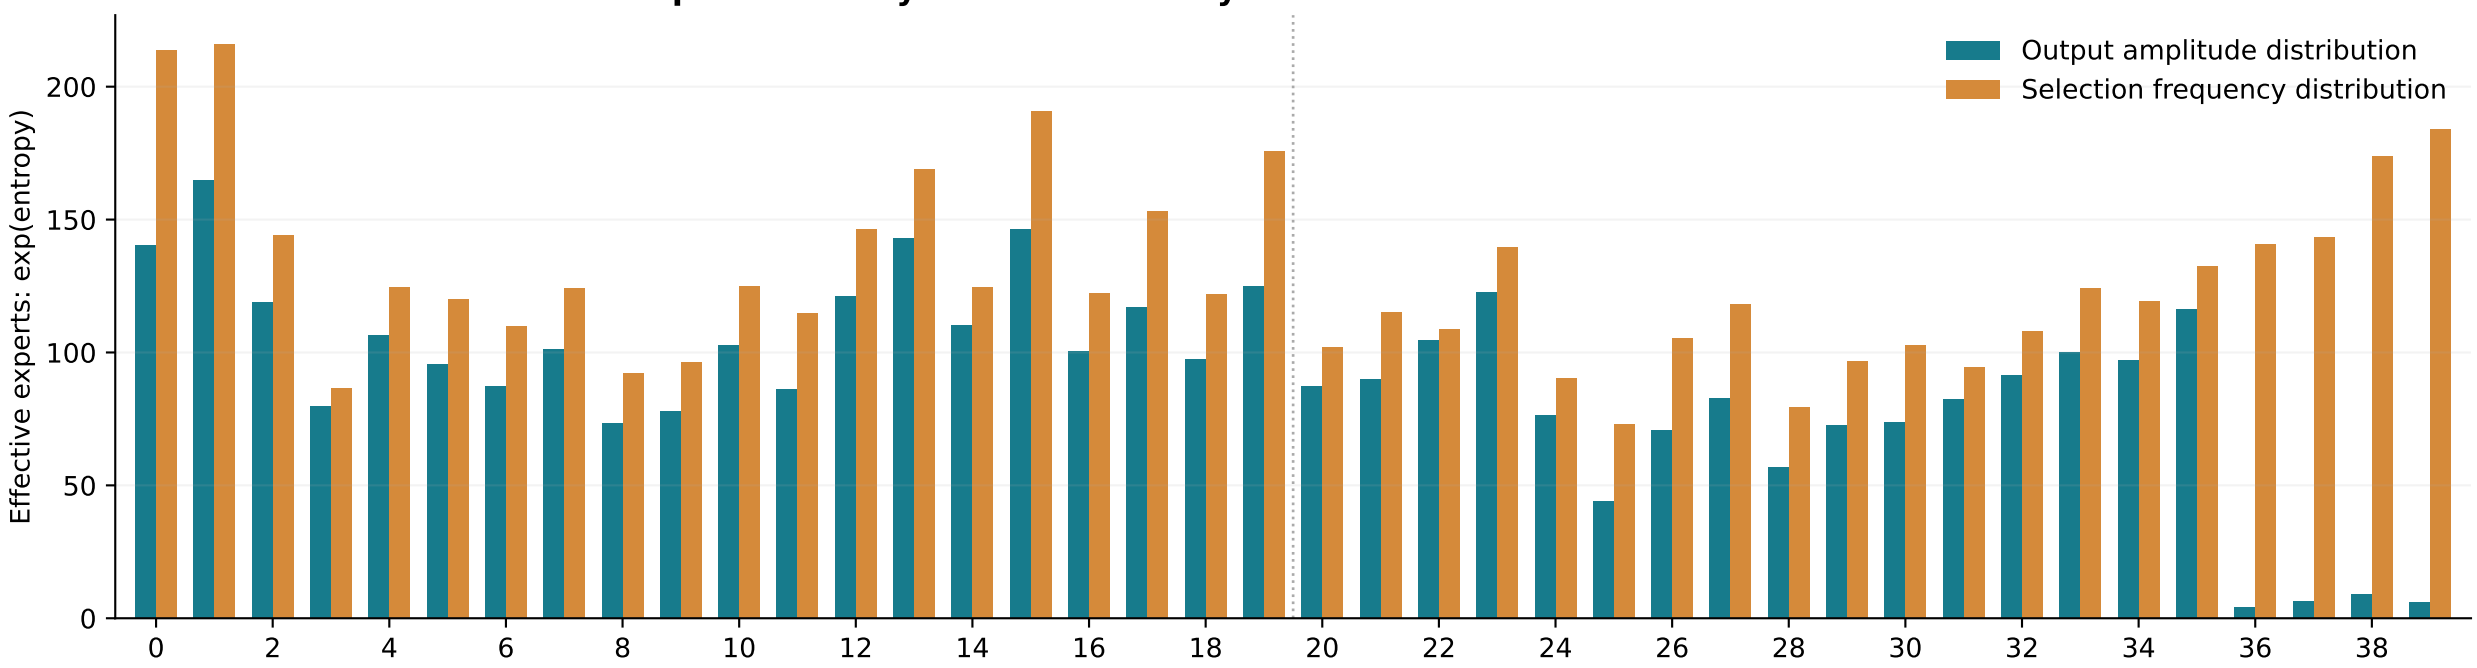
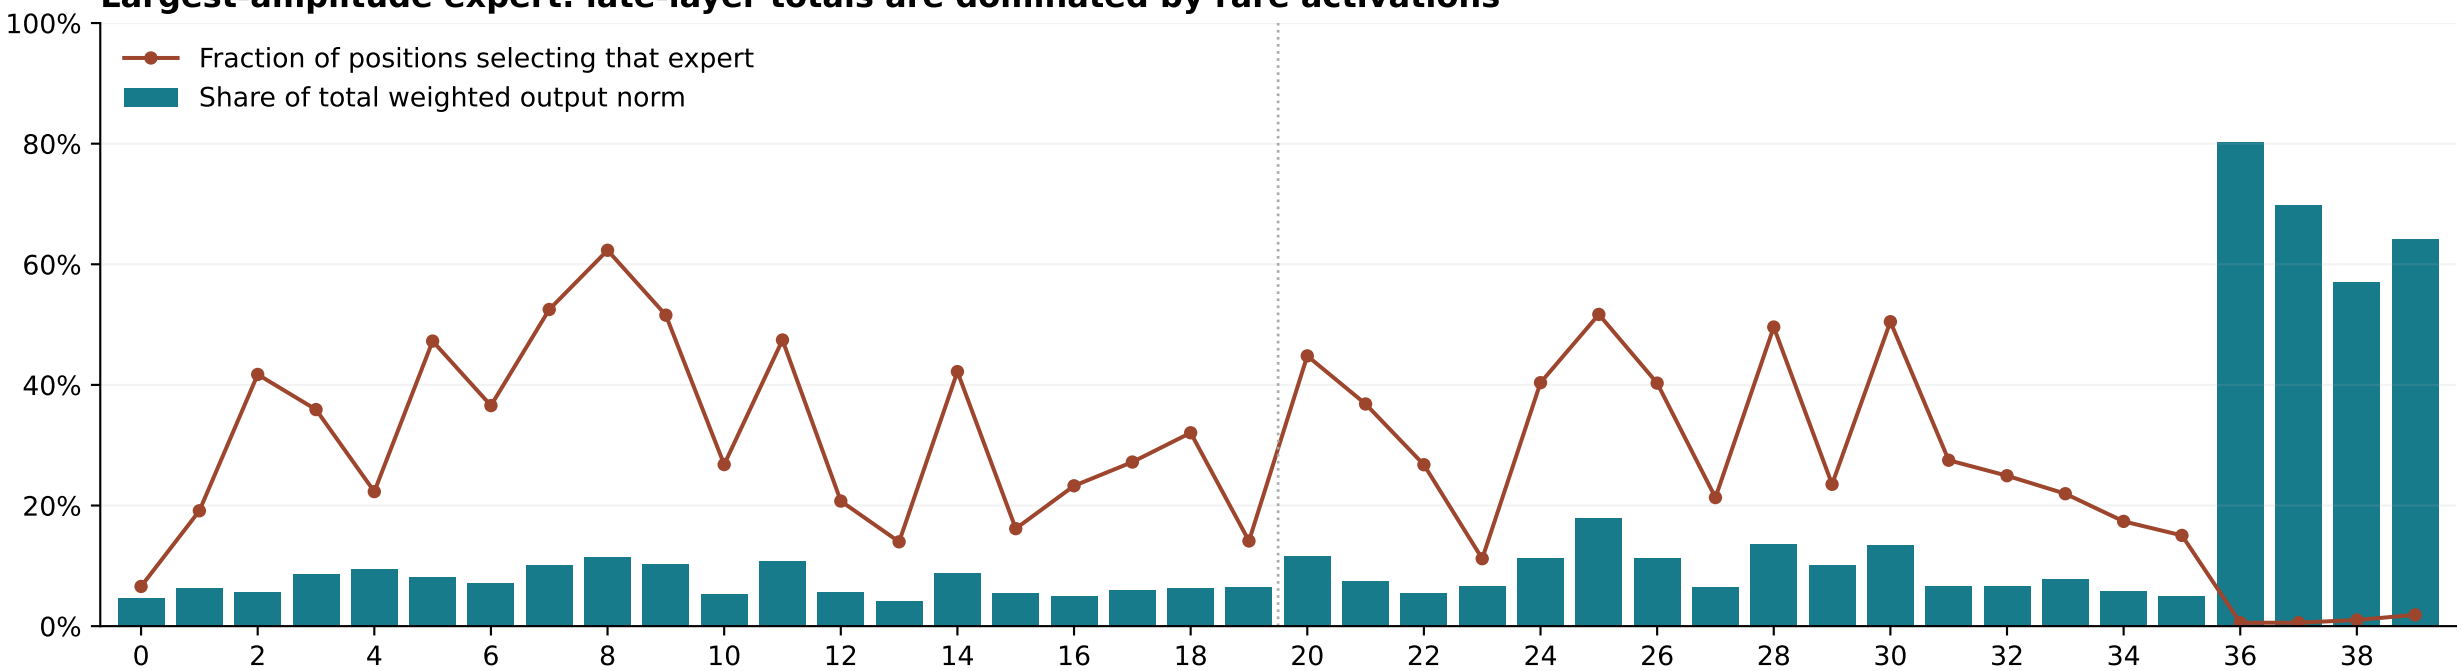
# E074 · Layer statistics

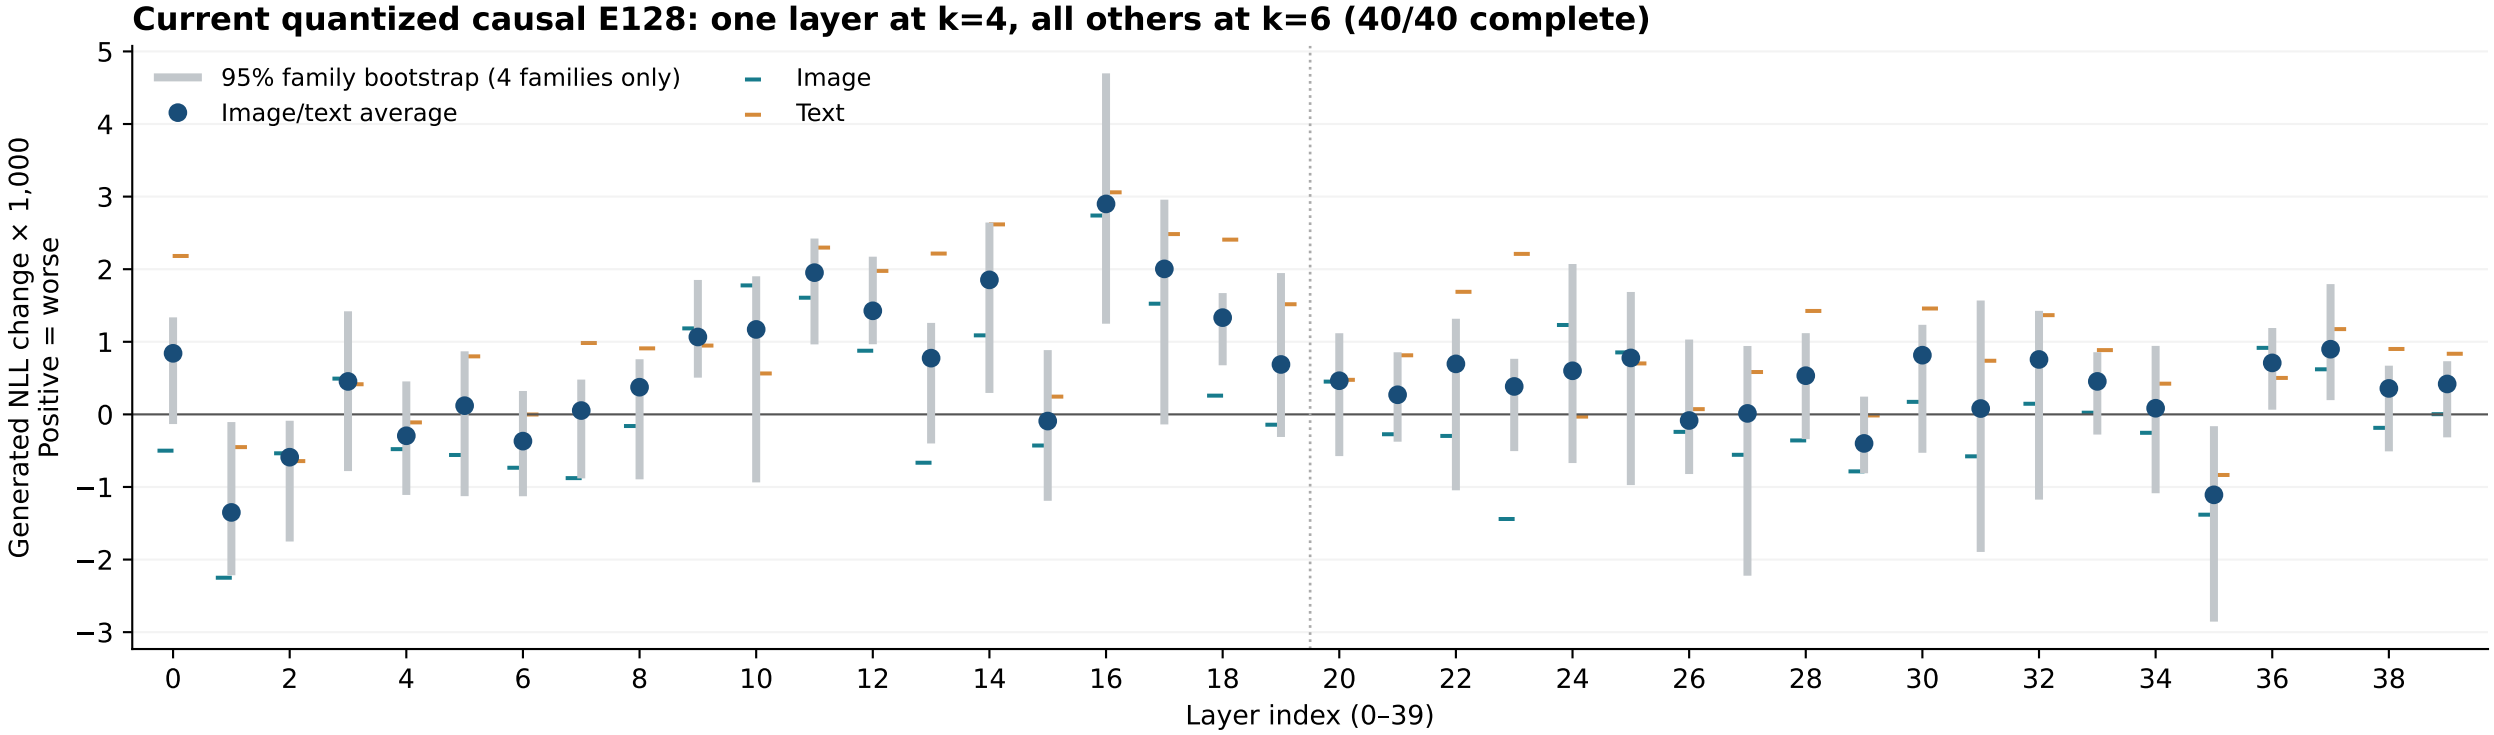
## Historical causal full model: expert diversity differs across layers



## Largest-amplitude expert: late-layer totals are dominated by rare activations



## Current quantized causal E128: one layer at k=4, all others at k=6 (40/40 complete)



Historical: 24,043,161 scored positions; pruning weights enc=[1,1,10,1], dec=[0,1,10,1].
Aggregate diversity is not per-token top-k. Current NLL is a small training-only screen, not ARC accuracy.
